Original publisher: Adelphi, MD : Army Research Laboratory, 2007 OCLC Number: (OCoLC)315893921 Subject: Radar -- Military applications. Excerpt: . . . technology for detecting the human presence in concealed environments, made the evaluation of the human body radar signature a problem of great interest. Such models are very useful in designing and predicting the performance of radar systems for human presence detection. 3. 1 Computational Grids As mentioned in section 2, most FDTD algorithms operate on a three-dimensional rectangular grid made of elementary cells. Each cell is assigned the dielectric properties of the material which occupies that region in space. Therefore, the objects need to be described by a volumetric mesh ( as opposed to surface integral equation methods, where only a description of the surface bounding an object is necessary ). For the human body modeling we used two different meshes, described in figure 2a and 2b. We found the mesh in figure 2a ( that we call the fat man ) on a Web site maintained by the U. S. Air Force Research Laboratory, RF Radiation Branch ( Brooks Air Force Base ) ( 10 ). ( Unfortunately, the page containing the human body models is no longer available. ) The meshes stored at this site represented highly detailed FDTD-compatible grids, where the dielectric properties of each human tissue are sampled using 1 mm, 2 mm, or 3 mm cubic cells. A detailed description of the body tissue dielectric properties was given in reference 11. In this report, the complex relative permittivity is modeled as a complicated function of frequency ( 4-Cole-Cole model ). Since the AFDTD code can only handle materials with frequency-independent dielectric constant and conductivity, throughout our simulations we employed their...
